

# Manufacturing Indaba 2018

**Attend a one day conference to come to grips with the Fourth Industrial Revolution**

**The Sandton Convention Centre in Johannesburg will be abuzz on the 21st June 2018 due to the one day conference that will focus exclusively on the Internet of Things (IoT) and Industry 4.0, otherwise known as the "Fourth Industrial Revolution".**

The event will reveal how these revolutionary technologies impact manufacturers and will provide attendees with the knowledge they need to understand how the latest global trends will affect the manufacturing industry. An annual 12% increase on average is expected on the number of connected Internet of Things (IoT) devices worldwide, which means the current number of approximately 27 billion will increase to 125 billion in 2030.

This emerging IoT movement not only has a significant impact on almost all aspects of the manufacturing industry, but on all facets of the economy as a whole. As the Fourth Industrial Revolution gains momentum, decision-makers from public and private sectors are confronted with a new set of uncertainties regarding the future of production. Smart technologies are transcending computing capabilities associated with the digital revolution, transforming the physical world through robotics and innovative production methodologies; enhancing human beings on a physical, mental, and experiential front; and permeating the environment to facilitate greater interconnectivity, monitoring, and efficiency of resource utilisation. Rapidly emerging technologies, such as the Internet of Things, Artificial Intelligence (AI), wearables, robotics and additive manufacturing, are spurring the development of new production techniques and business models that will fundamentally transform global production.

Furthermore, these technologies have the capacity to foster new, more distributed and collaborative supply chains. Together, the speed and scope of change contribute to the complexity of existing challenges associated with the tasks of developing and implementing industrial strategies that promote productivity and inclusive growth.\* As the premise of this year's conference, discussions centered around IoT will cover the fundamentals of connect, collect, compute and create, highlighting how manufacturers can capitalise on these innovations to optimise operations, create unique business models and solutions and enhance their ability to collate and use data through advanced, autonomous computation methodologies.
